## PUBLICATION PORTFOLIO

### Biocidal Effects of Copper Products

Reference	Conclusion	Link
Borkow, G., and Gabbay, J. (2005) <b>Copper as a biocidal tool.</b> <i>Current Medicinal Chemistry.</i> 12(18): 2163-2175.	Copper displays potent anti-bacterial, anti-fungal and anti-viral activities. The biocidal mechanism includes denaturation of nucleic acids; alteration of proteins; plasma membrane permeabilization; and membrane lipid peroxidation. Today copper is used as a water purifier, algacide, fungicide, nematocide, molluscicide, and as an anti-bacterial and anti-fouling agent.	<a href="http://www.bentham-direct.org/pages/content.php?CMC/2005/00000012/00000018/0005C.SGM">http://www.bentham-direct.org/pages/content.php?CMC/2005/00000012/00000018/0005C.SGM</a>
Borkow, G., and Gabbay, J. (2004) <b>Putting copper into action: copper impregnated products with potent biocidal activities.</b> <i>FASEB Journal.</i> 18: 1728-1730.	A platform technology was developed that binds copper-oxide to textile fibres from which woven and non-woven fabrics can be produced. Copper may be integrated into latex and other polymers during manufacture. These products possess broad-spectrum anti-microbial properties. This technology, for example, enables the production of anti-viral gloves and filters, anti-bacterial self-sterilizing fabrics, anti-fungal socks, and anti-dust mite mattress-covers. No skin sensitization or irritation is observed in animal studies.	<a href="http://www.fasebj.org/cgi/reprint/04-2029fjev1">http://www.fasebj.org/cgi/reprint/04-2029fjev1</a>
Zatcoff, R.C. <b>HealthStrides™ Socks—Footwear to a Higher Standard.</b> <i>Podiatry Management,</i> November/December 2005, pages 202-203.	A study with 56 patients demonstrate statistical improvement or resolution of several attributes related to athlete's foot by the sole use of socks containing copper-oxide impregnated fibers.	<a href="http://www.cupron.com/Articles/healthstrides.pdf">http://www.cupron.com/Articles/healthstrides.pdf</a>
Borkow, G., Sidwell, R.W., Smee, D.F., Barnard, D.L., Morrey, J.D., Lara-Villegas, H.H., Shemer-Avni, Y., and Gabbay, J. (2007) <b>Neutralizing viruses by copper oxide based filters.</b> <i>Antimicrobial Agents and Chemotherapy,</i> 51(7): 2605-2607.	Copper oxide-containing filters reduce infectious titers of a wide panel of viruses (including enveloped; non-enveloped; RNA and DNA viruses). This work suggests the possibility of using copper oxide-containing devices to deactivate a wide spectrum of infectious viruses found in filterable suspensions.	<a href="http://aac.asm.org/cgi/content/full/51/7/2605?view=long&amp;pmid=17470650">http://aac.asm.org/cgi/content/full/51/7/2605?view=long&amp;pmid=17470650</a>
Borkow, G., Gabbay, J. and	Copper plays a key role in wound healing. We hypothesized that	<a href="http://linkinghub.elsevier.com/retrieve/pii/S0306-">http://linkinghub.elsevier.com/retrieve/pii/S0306-</a>

Better Health Through Technology™

Zatcoff, R. (2007) <b>Could chronic wounds not heal due to too low local copper levels?</b> Medical Hypotheses, 70(3): 610-613	in individuals with compromised circulation to the wound site, part of the incapacity of the wounds to heal is due to low local copper levels. Wound dressings with copper would i) reduce the risk of contamination; and ii) stimulate faster wound repair directly.	9877(07)00412-4
Borkow, G., Gabbay, J. (2007) <b>Biocidal textiles can help fight nosocomial infections.</b> Medical Hypotheses, 70, 990-994.	Contaminated textiles in hospitals are an important source of microbes contributing to nosocomial infections. The use of antimicrobial textiles, especially in those textiles that are in close contact with the patients, may significantly reduce bioburden in clinical settings and consequently reduce the risk of nosocomial infections.	<a href="http://linkinghub.elsevier.com/retrieve/pii/S0306-9877(07)00568-3">http://linkinghub.elsevier.com/retrieve/pii/S0306-9877(07)00568-3</a>
Mumcuoglu, K.Y., Gabbay, J., and Borkow, G. (2008) <b>Copper oxide impregnated fabrics for the control of house dust mites.</b> International Journal of Pest Management. 54(3), 235- 240.	The acaricidal efficacy of copper-oxide containing fabrics on the common house dust mite, <i>Dermatophagoides farinae</i> is demonstrated in this manuscript. The acaricidal effect is via direct toxicity to the mites. The usage of fabrics containing copper oxide may thus be an important avenue for killing the house dust mite and reducing the load of dust mite allergens.	<a href="http://www.ingentaconnect.com/content/tandf/tpm/2008/00000054/00000003/art00006">http://www.ingentaconnect.com/content/tandf/tpm/2008/00000054/00000003/art00006</a>
Borkow, G., Lara, H.H., Covington, C.Y., Nyamathi, A., and Gabbay, J. (2008) <b>Deactivation of HIV-1 in Medium by Copper-Oxide Containing Filters.</b> Antimicrobial Agents and Chemotherapy. 52(2):518-525.	Filtration of HIV-1 through filters containing copper-impregnated fibers resulted in viral deactivation of all 12 wild-type or drug-resistant laboratory or clinical, M- or T-tropic, clades A, B, or C, HIV-1 isolates tested. Viral inactivation was not strain specific. Thus, a novel means to inactivate HIV-1 in medium has been developed.	<a href="http://aac.asm.org/cgi/content/full/52/2/518?view=long&amp;pmid=18070974">http://aac.asm.org/cgi/content/full/52/2/518?view=long&amp;pmid=18070974</a>
Zatcoff, R.C., Smith, M.S., and Borkow, G. (2008) <b>Treatment of tinea pedis with socks containing copper impregnated fibers.</b> The Foot. 18:136-41	Tinea pedis, known as Athlete's foot, is a common fungal infection of the feet. The effectiveness in using copper oxide impregnated socks in treating the common manifestations of tinea pedis, is demonstrated in the clinical study described in this manuscript.	<a href="http://linkinghub.elsevier.com/retrieve/pii/S095825920800028X">http://linkinghub.elsevier.com/retrieve/pii/S095825920800028X</a>

<p>Hofer, D. (2006) <b>Antimicrobial textiles, skin-borne flora and odour.</b> <i>Curr.Probl.Dermatol.</i> 33:67-77.</p>	<p>Abstract: Along with climate and physical activity, textiles have an effect on sweating and the development of odours. Accordingly, textiles inadequately optimized in terms of clothing technology as a result of poorly cut structures or poor materials result in increased sweating and odour. However, the development of body odour itself cannot be avoided, even with optimally designed clothing. Therefore new textiles, 'treated with antimicrobial agents', have been developed, with the aim of reducing odour by decreasing the number of germs on the skin. From the scientific point of view, the interactions between textiles, sweat, skin and skin flora are extremely complex. For this reason, this article explains in more detail the basic principles of odour formation resulting from sweat and how this can be influenced by textiles treated with antimicrobial agents.</p>	<p><a href="http://www.ncbi.nlm.nih.gov/pubmed/16766882">http://www.ncbi.nlm.nih.gov/pubmed/16766882</a></p>
<p><a href="http://www.copper.org:80/about/pressreleases/2008/pr2008_March_25.html">http://www.copper.org:80/about/pressreleases/2008/pr2008_March_25.html</a></p>	<p>The U.S. Environmental Protection Agency (EPA) has approved the registration of antimicrobial copper alloys, with public health claims. These public health claims acknowledge that copper, brass and bronze are capable of killing harmful, potentially deadly bacteria. Copper is the first solid surface material to receive this type of EPA registration, which is supported by extensive antimicrobial efficacy testing. Cupron has received an official permit to sale copper oxide impregnated fibers.</p>	<p><a href="http://www.copper.org:80/about/pressreleases/2008/pr2008_March_25.html">http://www.copper.org:80/about/pressreleases/2008/pr2008_March_25.html</a></p>

<p>C. Espí'rito Santo, N. Taudte, D.H. Nies, and G. Grass. (2008) <b>Contribution of Copper Ion Resistance to Survival of <i>Escherichia coli</i> on Metallic Copper Surfaces.</b> Applied and Environmental Microbiology, 74: 977–986.</p>	<p>Data presented in this study suggest that bacteria are killed rapidly on dry copper surfaces. Several factors, such as copper ion toxicity, copper chelators, cold, osmotic stress, and reactive oxygen species, but not anaerobiosis, influenced killing rates.</p>	<p><a href="http://aem.asm.org/cgi/content/abstract/AEM.01938-07v1">http://aem.asm.org/cgi/content/abstract/AEM.01938-07v1</a></p>
<p>J. J. Harrison, R.J. Turner, D.A. Joo, M.A. Stan, C.S. Chan, N. Allan, H.A. Vrionis, M.E. Olson, and H. Ceri. (2008) <b>Copper and Quaternary Ammonium Cations Exert Synergistic Bactericidal and Antibiofilm Activity against <i>Pseudomonas aeruginosa</i>.</b> Antimicrobial Agents and Chemotherapy, 52: 2870–2881</p>	<p>By using a high-throughput method for testing combinations of antimicrobials for synergistic activity against biofilms, it was identified that Cu<sup>2+</sup> works synergistically with quaternary ammonium compounds (QACs) to kill <i>Pseudomonas aeruginosa</i> biofilms, a microorganism involved in nosocomial infections. In some cases, adding Cu<sup>2+</sup> to QACs resulted in a 128-fold decrease in the biofilm minimum bactericidal concentration compared to that for single-agent treatments. In combination, these agents retained broad-spectrum antimicrobial activity that also eradicated biofilms of <i>Escherichia coli</i>, <i>Staphylococcus aureus</i>, <i>Salmonella enterica</i> serovar Cholerasuis, and <i>Pseudomonas fluorescens</i>. To investigate the mechanism of action, isothermal titration calorimetry was used to show that Cu<sup>2+</sup> and QACs do not interact in aqueous solutions, suggesting that each agent exerts microbiological toxicity through independent biochemical routes. Additionally, Cu<sup>2+</sup> and QACs, both alone and in combination, reduced the activity of nitrate reductases, which are enzymes that are important for normal biofilm growth. Collectively, the results of this study indicate that Cu<sup>2+</sup> and QACs are effective combinations of antimicrobials that may be used to kill bacterial biofilms.</p>	<p><a href="http://aac.asm.org/cgi/content/abstract/52/8/2870?maxtoshow=&amp;HITS=10&amp;hits=10&amp;RESULTFORMAT=&amp;fulltext=%C2%B5g&amp;searchid=1&amp;FIRSTINDEX=1220&amp;resourcetype=HWFIG">http://aac.asm.org/cgi/content/abstract/52/8/2870?maxtoshow=&amp;HITS=10&amp;hits=10&amp;RESULTFORMAT=&amp;fulltext=%C2%B5g&amp;searchid=1&amp;FIRSTINDEX=1220&amp;resourcetype=HWFIG</a></p>
<p>Salam A. Ibrahim a,* , Hong Yang b, Chung W. Seo. (2008) <b>Antimicrobial activity of lactic acid and copper on growth of Salmonella and Escherichia coli O157:H7 in laboratory medium and carrot juice.</b> Food Chemistry 109: 137–143.</p>	<p>The effect on the survival and growth of 38 Salmonella spp. and six E. coli O157:H7 strains were of either lactic acid (0.2%) alone, copper sulfate (50 ppm) alone or the combination of the two was studied. The growth inhibition was negligible when copper sulfate was added alone. Lactic acid (0.2%) retarded the growth of bacterial strains. However, the growth of bacterial strains was significantly inhibited when both lactic acid and copper were combined.</p>	<p><a href="http://74.125.45.104/search?q=cache:WDCxh2Rm39YJ:www.aseanfood.info/scripts/count_article.asp%3Farticle_code%3D11023135+Antimicrobial+activity+of+lactic+acid+and+copper+on+growth+of+Salmonella+and+Escherichia+coli+O157:H7+in+laboratory+medium+and+carrot+juice&amp;hl=en&amp;ct=clnk&amp;cd=1&amp;gl=us">http://74.125.45.104/search?q=cache:WDCxh2Rm39YJ:www.aseanfood.info/scripts/count_article.asp%3Farticle_code%3D11023135+Antimicrobial+activity+of+lactic+acid+and+copper+on+growth+of+Salmonella+and+Escherichia+coli+O157:H7+in+laboratory+medium+and+carrot+juice&amp;hl=en&amp;ct=clnk&amp;cd=1&amp;gl=us</a></p>

In 25 <math>\mu\text{M}</math> <math>\text{Cu}^{2+}</math> solution, the virus titer decreased by approximately 3 and 4 log within 3 and 6 h, respectively. Compared to <math>\text{Cu}^{2+}</math>, <math>\text{Zn}^{2+}</math> was much less effective in virus inactivation.</p>	<p><a href="http://www.springerlink.com/content/3234874542k7075x/">http://www.springerlink.com/content/3234874542k7075x/</a></p>
<p>Nan L, Liu Y, Lü M, Yang K. (2008) <b>Study on Antibacterial Mechanism of Copper-bearing Austenitic Antibacterial Stainless Steel by Atomic Force Microscopy</b> J Mater Sci Mater Med. 19(9):3057-62.</p>	<p>The antibacterial mechanism of copper-bearing austenitic antibacterial stainless steel by a series of methods such as atomic force microscopy (AFM) observation, force-distance curves and inductively coupled plasma mass spectrometer test were investigated. It was observed by AFM that the structure of the outer cell membrane responsible for the cell permeability was substantially changed for the bacteria after contacting with the antibacterial stainless steel, showing that cell walls were seriously damaged and a lot of contents in the cells leaked. It was also found that the adhesion force of bacteria to antibacterial stainless steel was considerably greater than that to the contrast steel, indicating that the electrostatic forces by <math>\text{Cu}^{2+}</math> being an important factor for killing bacteria.</p>	<p><a href="http://www.springerlink.com/content/771h15n33676t285/">http://www.springerlink.com/content/771h15n33676t285/</a></p>
<p>Gant VA, Wren MW, Rollins MS, Jeanes A, Hickok SS, and Hall TJ. (2007) <b>Three novel highly charged copper-based biocides: safety and efficacy against healthcare-associated organisms.</b> Journal of Antimicrobial Chemotherapy 60, 294–299.</p>	<p>Three copper-based inorganic formulations were tested for their activity against clinical isolates of methicillin-resistant Staphylococcus aureus (MRSA), Legionella pneumophila, Acinetobacter calcoaceticus/baumannii (ACCB), glycopeptide-resistant Enterococcus and spores of Clostridium difficile in time-kill assays; for their ability to decontaminate ultramicrofibre (UMF) cloths; and (iii) for their cytotoxicity to human skin and intestinal epithelial cells. All three copper-based formulations were potently biocidal down to concentrations of 1 ppm for both stationary- and log-phase organisms, and they were all active against C. difficile spores. At 150 ppm, they achieved a complete (&gt;6 log<sub>10</sub>) kill of MRSA and ACCB mostly within 1 h. This biocidal activity was not achieved by copper sulphate or the inorganic binders used in the formulations. All three copper-based formulations completely decontaminated UMF cloths containing MRSA, ACCB or C. difficile spores. All three copper-based formulations and copper sulphate were not cytotoxic to human epithelial cells up to concentrations of 100-200 ppm.</p>	<p><a href="http://jac.oxfordjournals.org/cgi/content/abstract/dkm201v1">http://jac.oxfordjournals.org/cgi/content/abstract/dkm201v1</a></p>

## Microbial Resistance to Silver

Reference	Conclusion / Abstract	Link
<p>Silvestry-Rodriguez, N., E. E. Sicairos-Ruelas, C. P. Gerba, and K. R. Bright. (2007) <b>Silver as a disinfectant.</b> <i>Rev. Environ. Contam Toxicol.</i> 191:23-45.</p>	<p>Abstract: Silver has been used as an antimicrobial for thousands of years. Over the past several decades, it has been introduced into numerous new venues such as in the treatment of water, in dietary supplements, in medical applications, and to produce antimicrobial coatings and products...Many mechanisms of the antibacterial effect of silver have been described, but its antiviral and antiprotozoal mechanisms are not well understood. Both microbial tolerance and resistance to silver have been reported; however, the effect of silver has been observed against a wide variety of microorganisms over a period of years. Further research is needed to determine the antimicrobial efficacy of silver in these new applications and the effects of its long-term usage</p>	<p><a href="http://www.springerlink.com/content/tg6315643164271t/">http://www.springerlink.com/content/tg6315643164271t/</a></p>
<p>Silver, S., I. T. Phung, and G. Silver. (2006). <b>Silver as biocides in burn and wound dressings and bacterial resistance to silver compounds.</b> <i>J. Ind. Microbiol. Biotechnol.</i> 33:627-634.</p>	<p>Abstract: Silver products have been used for thousands of years for their beneficial effects, often for hygiene and in more recent years as antimicrobials on wounds from burns, trauma, and diabetic ulcers. Silver sulfadiazine creams (Silvazine and Flamazine) are topical ointments that are marketed globally. In recent years, a range of wound dressings with slow-release Ag compounds have been introduced, including Acticoat, Actisorb Silver, Silverlon, and others. While these are generally accepted as useful for control of bacterial infections (and also against fungi and viruses), key issues remain, including importantly the relative efficacy of different silver products for wound and burn uses and the existence of microbes that are resistant to Ag+. These are beneficial products needing further study, although each has drawbacks. The genes (and proteins) involved in bacterial resistance to Ag have been defined and studied in recent years</p>	<p><a href="http://www.springerlink.com/content/e66l0g6125655482/">http://www.springerlink.com/content/e66l0g6125655482/</a></p>

<p>Ahmed, Z., B. D. Idowu, and R. A. Brown. (1999). <b>Stabilization of fibronectin mats with micromolar concentrations of copper.</b> <i>Biomaterials</i> 20:201-209.</p>	<p>Abstract: ...The aim of this study was to examine means of increasing the stability of Fn-mats using a novel treatment with micromolar concentrations of copper ions which may be used to improve wound healing/nerve repair. Cytotoxicity of incorporated copper was determined using rat Schwann cells, rat tendon fibroblasts and human dermal fibroblasts. Dissolution of protein from the Fn-mat showed that treatment with the lowest concentration of copper used (1 microM) increased the stability of mats by 3-4 times at room temperature relative to control mats and twofold at 37 degrees C. Copper mediated increase in stability was dose dependent. Orientation of the Fn-fibres (within mats), monitored by scanning electron microscopy was retained with 1 microM copper but disappeared with higher concentrations. Schwann cells grew in culture with mats stabilized by 1 microM copper treatment without reduction in cell number but growth was inhibited at 10-200 microM Cu. All types of fibroblasts were unaffected by copper treatment upto 200 microM. Fn-mats can be successfully stabilized by this technique producing longer survival in vitro. The differential effects of copper on these cell types suggests that CuFn-mats may be used to select the type of cells which colonize these materials</p>	<p><a href="http://www.ncbi.nlm.nih.gov/pubmed/10030596">http://www.ncbi.nlm.nih.gov/pubmed/10030596</a></p>

Simeon, A., F. Monier, H. Emonard, P. Gillery, P. Birembaut, W. Hornebeck, and F. X. Maquart. (1999) **Expression and activation of matrix metalloproteinases in wounds: modulation by the tripeptide-copper complex glycyl-L-histidyl-L-lysine-Cu<sup>2+</sup>**. *J Invest Dermatol.* 112:957-964.

Abstract: We investigated the expression and activation of matrix metalloproteinases in a model of experimental wounds in rats, and their modulation by glycyl-L-histidyl-L-lysine-Cu(II), a potent activator of wound repair. Wound chambers were inserted under the skin of Sprague-Dawley rats and received serial injections of either 2 mg glycyl-L-histidyl-L-lysine-Cu(II) or the same volume of saline. The wound fluid and the neosynthesized connective tissue deposited in the chambers were collected and analyzed for matrix metalloproteinase expression and/or activity. Interstitial collagenase increased progressively in the wound fluid throughout the experiment. Glycyl-L-histidyl-L-lysine-Cu(II) treatment did not alter its activity. Matrix metalloproteinase-9 (gelatinase B) and matrix metalloproteinase-2 (gelatinase A) were the two main gelatinolytic activities expressed during the healing process. Pro-matrix metalloproteinase (pro-form of matrix metalloproteinase)-9 was strongly expressed during the early stages of wound healing (day 3). In the wound fluid, it decreased rapidly and disappeared after day 18, whereas in the wound tissue, matrix metalloproteinase-9 expression persisted in the glycyl-L-histidyl-L-lysine-Cu(II) injected chamber until day 22. Pro-matrix metalloproteinase-2 was expressed at low levels at the beginning of the healing process, increased progressively until day 7, then decreased until day 18. Activated matrix metalloproteinase-2 was present in wound fluid and wound tissue. It increased until day 12, then decreased progressively. Glycyl-L-histidyl-L-lysine-Cu(II) injections increased pro-matrix metalloproteinase-2 and activated matrix metalloproteinase-2 during the later stages of healing (days 18 and/or 22). These results demonstrate that various types of matrix metalloproteinases are selectively expressed or activated at the various periods of wound healing. Glycyl-L-histidyl-L-lysine-Cu(II) is able to modulate their expression and might significantly alter wound remodeling

<p>Maquart, F. X., G. Bellon, B. Chaqour, J. Wegrowski, L. M. Patt, R. E. Trachy, J. C. Monboisse, F. Chastang, P. Birembaut, P. Gillery, and . (1993) <b>In vivo stimulation of connective tissue accumulation by the tripeptide-copper complex glycyl-L-histidyl-L-lysine-Cu<sup>2+</sup> in rat experimental wounds.</b> <i>J Clin Invest</i> 92:2368-2376.</p>	<p>Abstract: The tripeptide-copper complex glycyl-L-histidyl-L-lysine-Cu<sup>2+</sup> (GHK-Cu) was first described as a growth factor for differentiated cells. Recent in vitro data showed that it possesses several properties of a potential activator of wound repair. We investigated the effects of GHK-Cu in vivo, using the wound chamber model described previously (Schilling, J.A., W. Joel, and M.T. Shurley, 1959. <i>Surgery [St. Louis]</i>. 46:702-710). Stainless steel wire mesh cylinders were implanted subcutaneously on the back of rats. The animals were divided into groups that received sequential injections into the wound chamber of either saline (control group) or various concentrations of GHK-Cu. At the end of the experiments, rats were killed, wound chambers were collected, and their content was analyzed for dry weight, total proteins, collagen, DNA, elastin, glycosaminoglycans, and specific mRNAs for collagens and TGF beta. In the GHK-Cu-injected wound chambers, a concentration-dependent increase of dry weight, DNA, total protein, collagen, and glycosaminoglycan contents was found. The stimulation of collagen synthesis was twice that of noncollagen proteins. Type I and type III collagen mRNAs were increased but not TGF beta mRNAs. An increase of the relative amount of dermatan sulfate was also found. A control tripeptide, L-glutamyl-L-histidyl-L-proline, had no significant effect. These results demonstrate that GHK-Cu is able to increase extracellular matrix accumulation in wounds in vivo</p>	<p><a href="http://www.jci.org/articles/view/116842">http://www.jci.org/articles/view/116842</a></p>
<p>Raju, K. S., G. Alessandri, M. Ziche, and P. M. Gullino. (1982) <b>Ceruloplasmin, copper ions, and angiogenesis.</b> <i>J Natl.Cancer Inst.</i> 69:1183-1188.</p>	<p>Abstract: The ability to induce new formation of capillaries in the cornea was tested for ceruloplasmin, the copper carrier of serum, for fragments of the ceruloplasmin molecule with and without copper, for heparin, and for glycyl-L-histidyl-L-lysine, bound or not bound to copper ions. Male or female 2- to 3-kg New Zealand White rabbits were used. These experiments were prompted by the previous observation of copper accumulation in the cornea during angiogenesis and by the inability of copper-deficient rabbits to mount an angiogenic response. The results showed that the three different molecules were all able to induce angiogenesis provided that they were bound to copper. Fragments of the ceruloplasmin molecule also induced angiogenesis but only when copper was bound to the peptides. The data are interpreted to indicate that copper ions are involved in the sequence of events leading to angiogenesis and that the carrier molecules may be of quite a different nature</p>	<p><a href="http://www.ncbi.nlm.nih.gov/pubmed/6182332">http://www.ncbi.nlm.nih.gov/pubmed/6182332</a></p>

Tapiero, H., D. M. Townsend, and K. D. Tew. (2003) <b>Trace elements in human physiology and pathology. Copper.</b> <i>Biomed.Pharmacother.</i> 57:386-398.	Abstract: Copper is a trace element, important for the function of many cellular enzymes. Copper ions can adopt distinct redox states oxidized Cu(II) or reduced (I), allowing the metal to play a pivotal role in cell physiology as a catalytic cofactor in the redox chemistry of enzymes, mitochondrial respiration, iron absorption, free radical scavenging and elastin cross-linking...	<a href="http://www.ncbi.nlm.nih.gov/pubmed/14652164">http://www.ncbi.nlm.nih.gov/pubmed/14652164</a>
Olivares, M. and R. Uauy. (1996) <b>Copper as an essential nutrient.</b> <i>Am.J Clin.Nutr.</i> 63:791S-796S.	Abstract: Animal and human studies have shown that copper is involved in the function of several enzymes. Studies have also shown that copper is required for infant growth, host defense mechanisms, bone strength, red and white cell maturation, iron transport, cholesterol and glucose metabolism, myocardial contractility, and brain development. Copper deficiency can result in the expression of an inherited defect such as Menkes syndrome or in an acquired condition....	<a href="http://www.ncbi.nlm.nih.gov/pubmed/8615366">http://www.ncbi.nlm.nih.gov/pubmed/8615366</a>
Uauy, R., M. Olivares, and M. Gonzalez. (1998) <b>Essentiality of copper in humans.</b> <i>Am.J Clin.Nutr.</i> 67:952S-959S.	Abstract: The biochemical basis for the essentiality of copper, the adequacy of the dietary copper supply, factors that condition deficiency, and the special conditions of copper nutriture in early infancy are reviewed. New biochemical and crystallographic evidence define copper as being necessary for structural and catalytic properties of cuproenzymes...	<a href="http://www.ajcn.org/cgi/reprint/67/5/952S">http://www.ajcn.org/cgi/reprint/67/5/952S</a>
Barceloux, D. G. (1999) <b>Copper.</b> <i>J.Toxicol.Clin.Toxicol.</i> 37:217-230.	Abstract: Copper is an essential trace element, which is an important catalyst for heme synthesis and iron absorption. Following zinc and iron, copper is the third most abundant trace element in the body.....The average daily intake of copper in the US is about 1 mg Cu with the primary source being the diet. The bioavailability of copper from the diet is about 65-70% depending on a variety of factors including chemical form, interaction with other metals, and dietary components... Chronic copper toxicity is rare and primarily affects the liver.	<a href="http://www.ncbi.nlm.nih.gov/pubmed/10382557">http://www.ncbi.nlm.nih.gov/pubmed/10382557</a>

Weir, F. W. (1979) <b>Health hazard from occupational exposure to metallic copper and silver dust.</b> <i>Am.Ind.Hyg.Assoc.J.</i> 40:245-247.	Abstract: This review of the toxicity and occupational hazard from exposure to metallic copper and silver dust was undertaken to examine the bases for the current standards and to suggest an alternative approach to controlling potential occupational hazard in conditions where exposures are limited to the prime metals. There are no data to suggest that exposure to silver or copper metal dust has produced remarkable disease in man. Further, there is no reason to consider the dust from either of these metals to be anything but nuisance particulate as defined by the ACGIH. They should, therefore, be regulated as such at the recommended level of 10 mg/m <sup>3</sup>	<a href="http://www.ncbi.nlm.nih.gov/pubmed/495463">http://www.ncbi.nlm.nih.gov/pubmed/495463</a>

Chen, X. and H. J. Schluesener. (2008)  
**Nanosilver: a nanoproduct in  
medical application.** *Toxicol.Lett.*  
176:1-12.

Abstract: Nanotechnology is a most promising field for generating new applications in medicine. However, only few nanoproducts are currently in use for medical purposes. A most prominent nanoproduct is nanosilver... At nanoscale, silver exhibits remarkably unusual physical, chemical and biological properties. Due to its strong antibacterial activity, nanosilver coatings are used on various textiles but as well as coatings on certain implants. Further, nanosilver is used for treatment of wounds and burns or as a contraceptive and marketed as a water disinfectant and room spray. Thus, use of nanosilver is becoming more and more widespread in medicine and related applications and due to increasing exposure toxicological and environmental issues need to be raised. In sharp contrast to the attention paid to new applications of nanosilver, few studies provide only scant insights into the interaction of nanosilver particle with the human body after entering via different portals. Biodistribution, organ accumulation, degradation, possible adverse effects and toxicity are only slowly recognized and this review is focusing on major questions associated with the increased medical use of nanosilver and related nanomaterials
